LonDownS

Dementia in older adults with Down syndrome

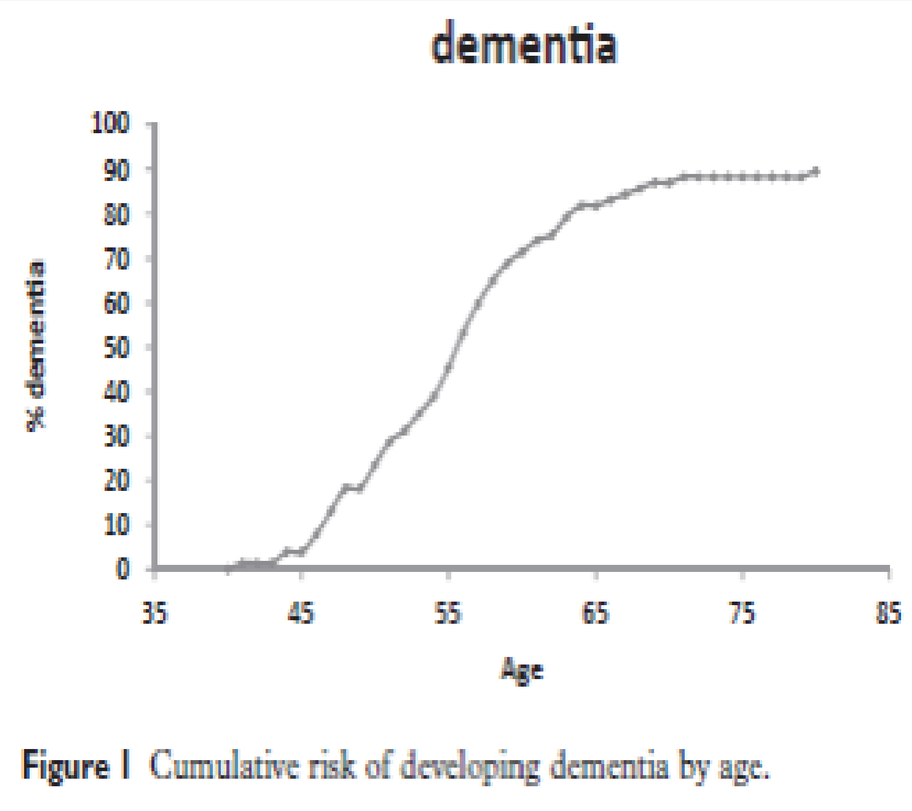

Figure 1 Cumulative risk of developing dementia by age.

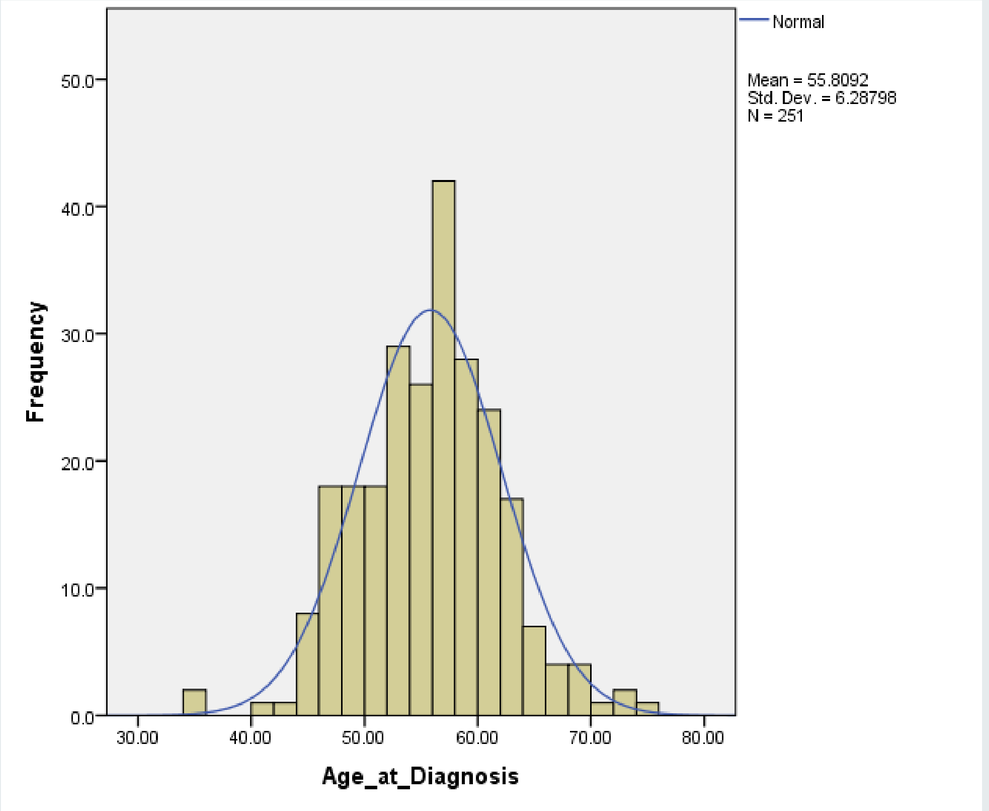
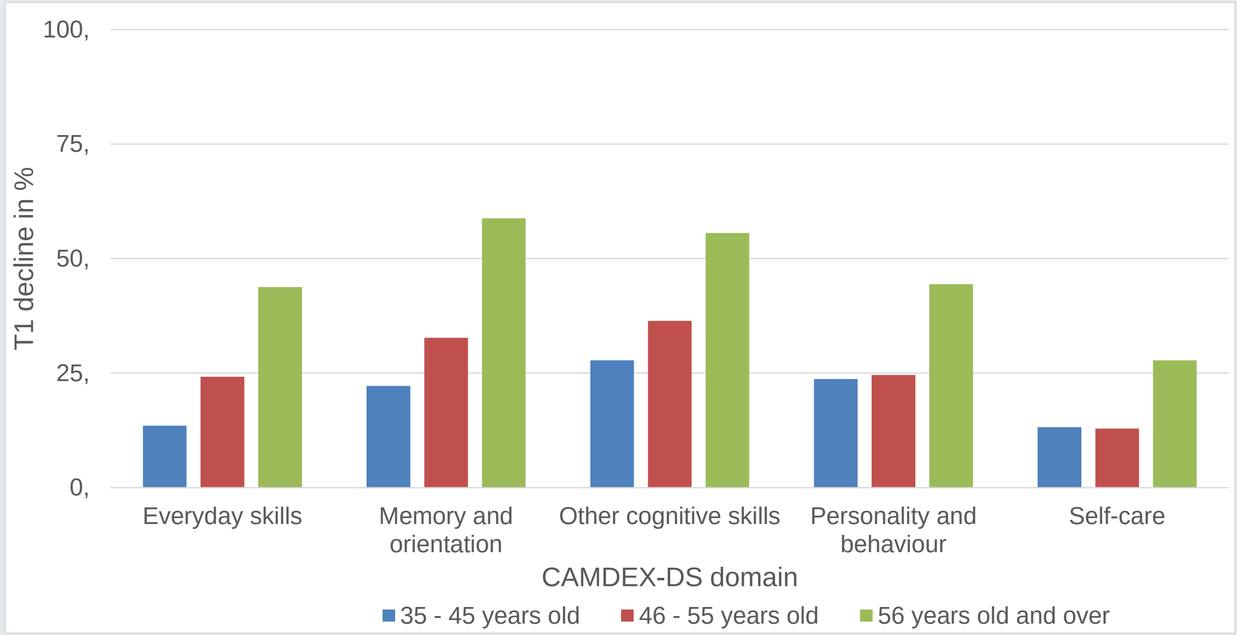


Dementia may affect more than 90% of older adults with Down syndrome
Develops 2-3 decades earlier compared to other people with Alzheimer's

McCarron, M., McCallion, P., Reilly, E., & Mulryan, N. (2014). A prospective 14-year longitudinal follow-up of dementia in persons with Down syndrome. Journal of Intellectual Disability Research, 58(1), 61-70.

Sinai, A., Mokrysz, C., Bernal, J., Bohnen, I., Bonell, S., Courtenay, K., ... & McBrien, J. Strydom, A. (2018). Predictors of age of diagnosis and survival of Alzheimer's disease in down syndrome. *Journal of Alzheimer's Disease*, (2017).

Development of dementia symptoms



- **Incidence of any new dementia symptoms in individuals aged 36 and older:**

- 25 per 100 person-years (95% CI = 16.18 – 36.90)

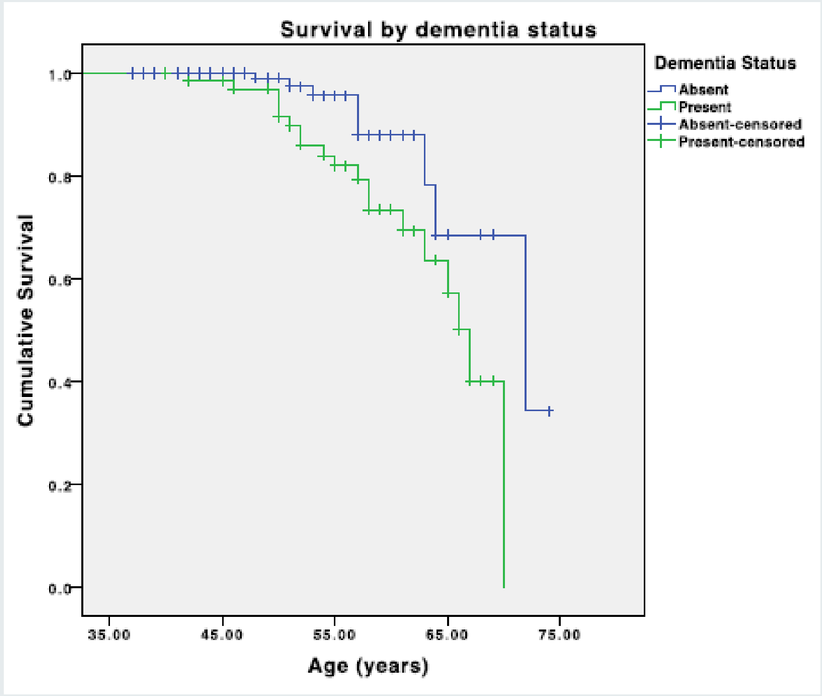
Mortality in older adults with Down syndrome

In our LonDowns study, older adults (age 36 and older; n = 211)

27 died during 2 years of follow up

- 70% had a clinical diagnosis of dementia before they died
- Most of the rest showed signs of dementia (seizures) before they died

Alzheimer's disease is now the main cause of death in adults with Down syndrome



Hithersay R, Startin CM, Hamburg S, et al. Association of Dementia With Mortality Among Adults With Down Syndrome Older Than 35 Years. JAMA Neurol. Published online November 19, 2018. doi:10.1001/jamaneurol.2018.3616

Age at diagnosis and survival

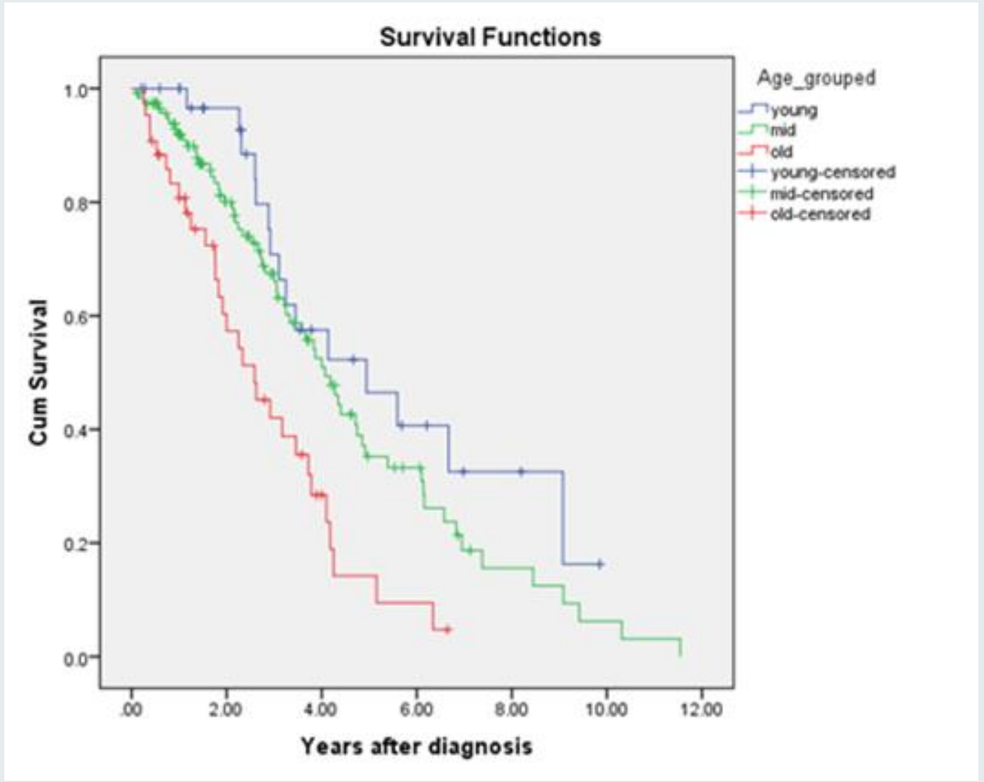
Mean survival after diagnosis of dementia

4.44 years (mean age at death of 59.98 years, SD 5.98, range 46.9 – 75.0 years)

If diagnosed before age 50 - median survival 4.94 years (95% CI 2.22 - 7.66)

Between 50-60 - median survival of 4.06 years (95% CI 3.36 – 4.75)

After 60 - median survival of 2.56 years (95% CI 1.56 – 3.58)

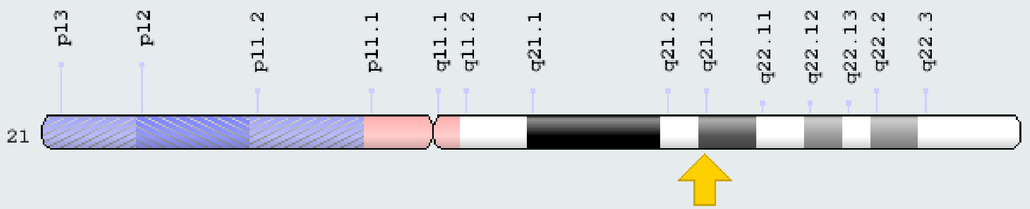


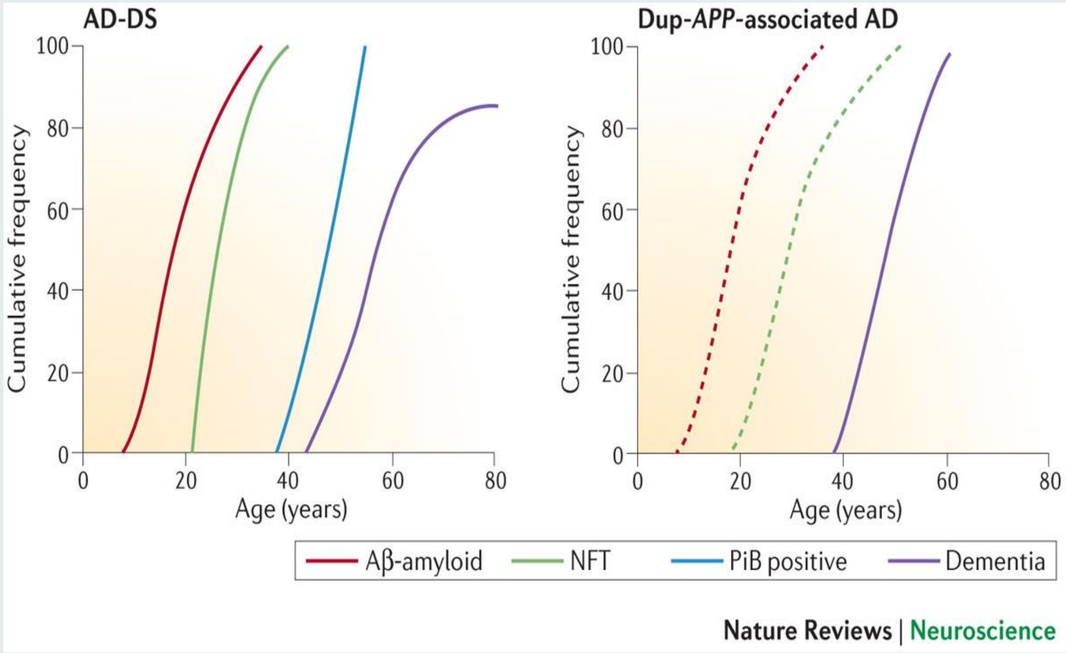
Sinai, A., Mokrysz, C., Bernal, J., Bohnen, I., Bonell, S., Courtenay, K., ... & McBrien, J. Strydom, A. (2018). Predictors of age of diagnosis and survival of Alzheimer's disease in Down syndrome. *Journal of Alzheimer's Disease*.

Alzheimer's in Down syndrome is a genetic condition

- DS is due to having 3 copies of chromosome 21, with 3 copies instead of two) of Chr21 genes
- Some of these genes are dosage-sensitive
- Amyloid precursor protein (APP) gene is on chr21; all DS individuals with full trisomy 21 have 3 x APP

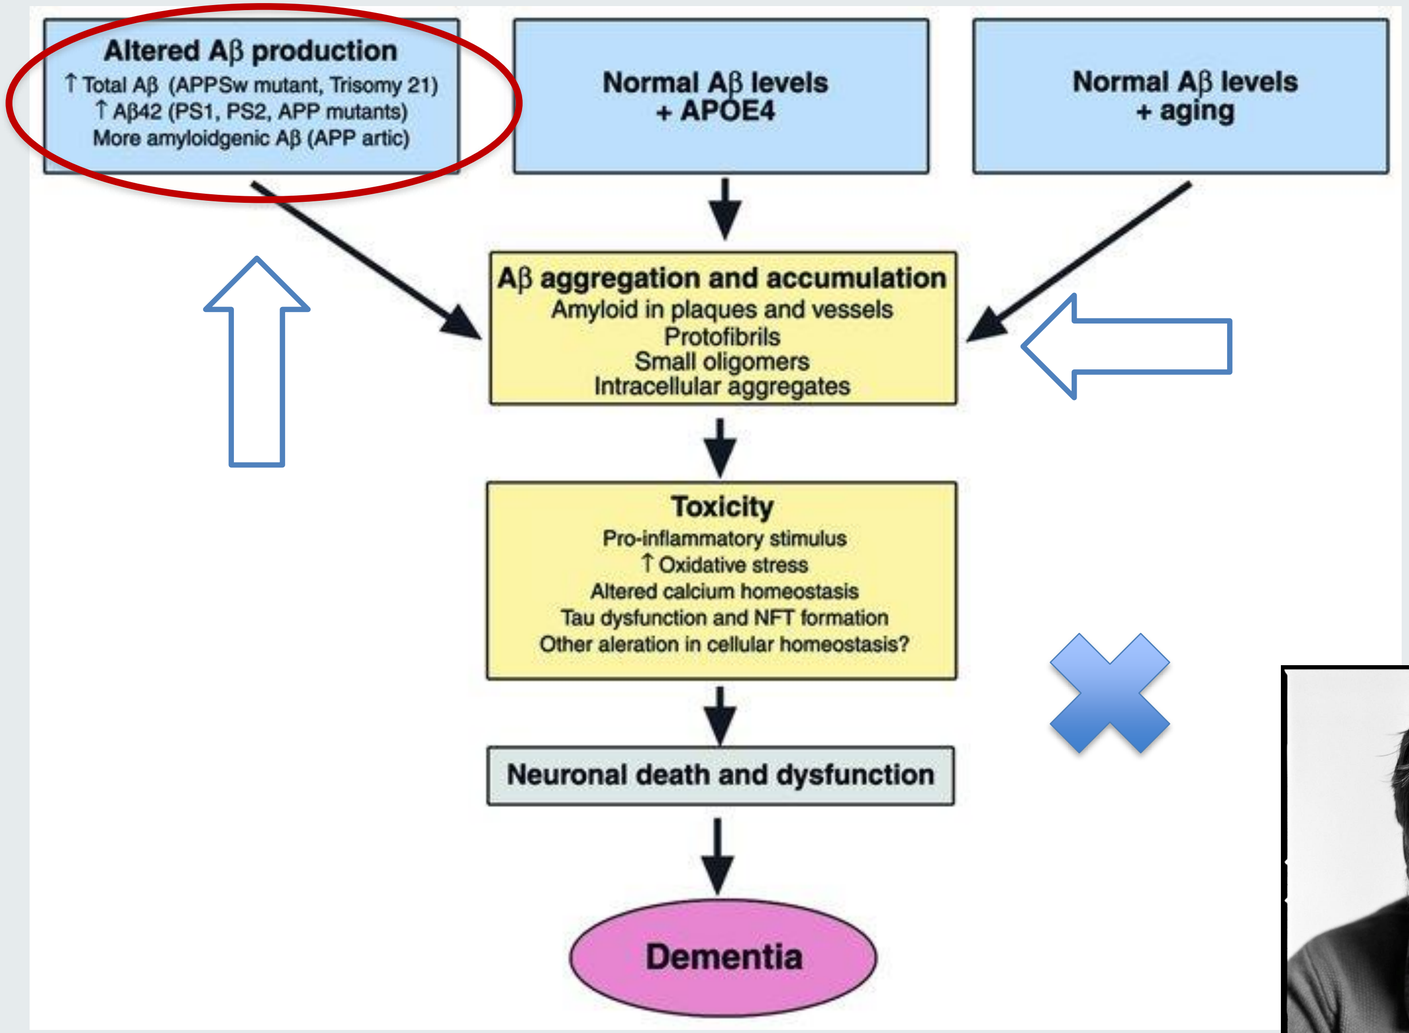
- Rare individuals with DS without an extra APP do not develop AD
- Rare individuals with Duplication APP (without DS) all present with AD





Wiseman, F. K., Al-Janabi, T., Hardy, J., Karmiloff-Smith, A., Nizetic, D., Tybulewicz, V. L., ... & Strydom, A. (2015). A genetic cause of Alzheimer disease: mechanistic insights from Down syndrome. Nature Reviews Neuroscience.

Amyloid cascade and preventing Alzheimer's



Amyloid β is increased in Down syndrome

SIMOA - single molecule immunoassays allows single molecules to be counted, with 1000-fold increase in sensitivity

Age matched DS, controls and AD cases

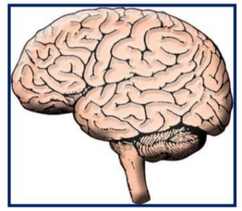
What is our work about?

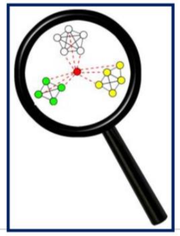
We are finding out about people with Down syndrome

.



- We want to find out how different parts of the brain work in people with Down syndrome

- We want to find out about differences between people with Down syndrome



- We want to find out if there are genetic or other reasons for this. Genes are like a recipe. They make us who we are.

Do you have to take part?

You can tell us **Yes** if you want to take part

You can tell us **No** if you do not want to take part

If you say no it will **not** change the care you get

If you decide to take part, we will ask you to sign a **consent form**

LonDowns Cohort

		Younger children (0-5·5 years)	Older children (5·5-15 years)	Younger adults (16-35 years)	Older adults (36+ years)
Number		115	35	170	282
Age		2·18 ± 1·13 (3·6 months to 5 years 1·3 months)	10·63 ± 3·05 (5 years 6·5 months to 14 years 8·5 months)	25·25 ± 5·46 (16-35 years)	50·21 ± 7·76 (36-73 years)
Sex	Male	62 (53·9%)	16 (45·7%)	83 (48·8%)	153 (54·3%)
	Female	53 (46·1%)	19 (54·3%)	87 (51·2%)	129 (45·7%)
Ethnicity	White	93 (81·6%)	25 (86·2%)	145 (85·3%)	261 (92·6%)
	Black	5 (4·4%)	0 (0·0%)	7 (4·1%)	11 (3·9%)
	Asian	6 (5·3%)	0 (0·0%)	8 (4·7%)	6 (2·1%)
	Mixed	7 (6·1%)	4 (13·8%)	8 (4·7%)	2 (0·7%)
	Other	3 (2·6%)	0 (0·0%)	2 (1·2%)	2 (0·7%)

All participants:
In-depth cognitive phenotyping
Detailed medical history
DNA samples
Cell samples
EEG/ ERP

Adults:
Plasma biomarker samples
fNIRS, longitudinal EEG

Older adults (>36):
Longitudinal cognitive/ clinical/ fluid biomarker data after 2 & 4 years

LonDownsPREVENT:

- Run-in trial cohort aged 30 – 55 (n = 120), with younger contrast group
- CSF at baseline
- Annual cognitive assessments
- Plasma
- MRI (Structural, SWI, DTI, ASL, fMRI)

Can we measure early changes due to Alzheimer’s in people with Down syndrome?

Cognitive profile in Down syndrome

Visuospatial learning is better than visual object learning due to relatively preserved maturation of the dorsal compared to ventral components of the visual system

Non-verbal abilities better than verbal abilities ; receptive language is better than expressive language

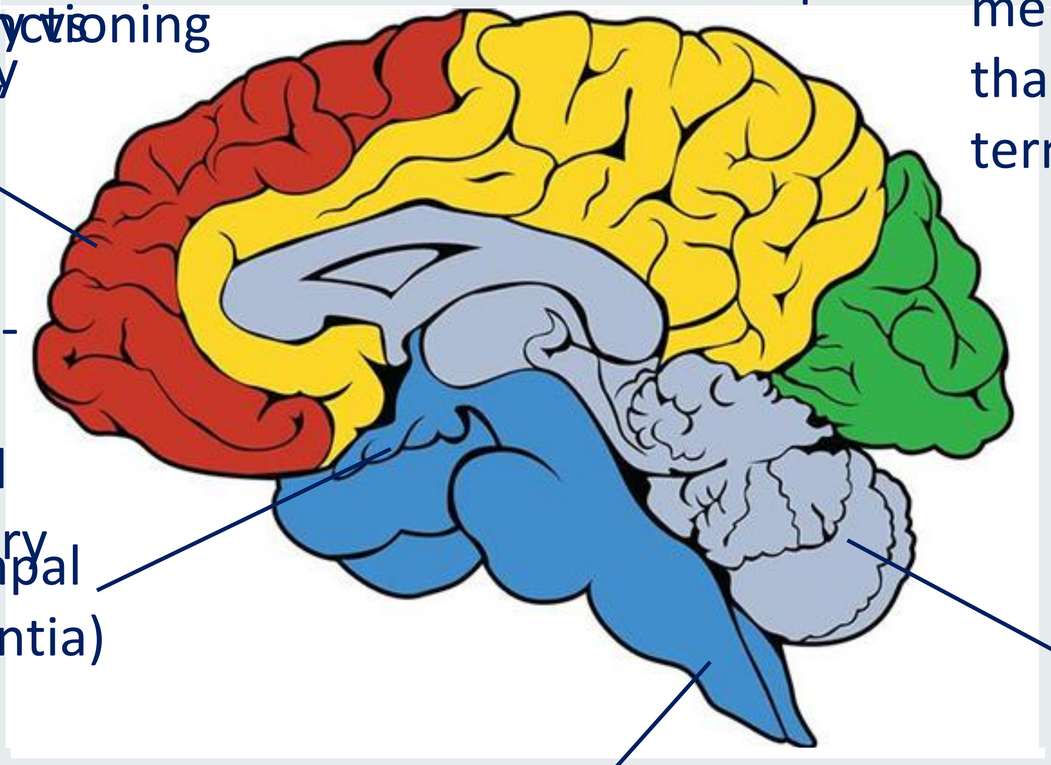
Relative weakness in short-term memory vs long-term memory

Relative weakness in executive functioning

Relative weakness in auditory short-term memory

Hypofrontality

Implicit long-term memory is better than explicit long-term memory



Visuospatial short-term memory is better than verbal short-term memory

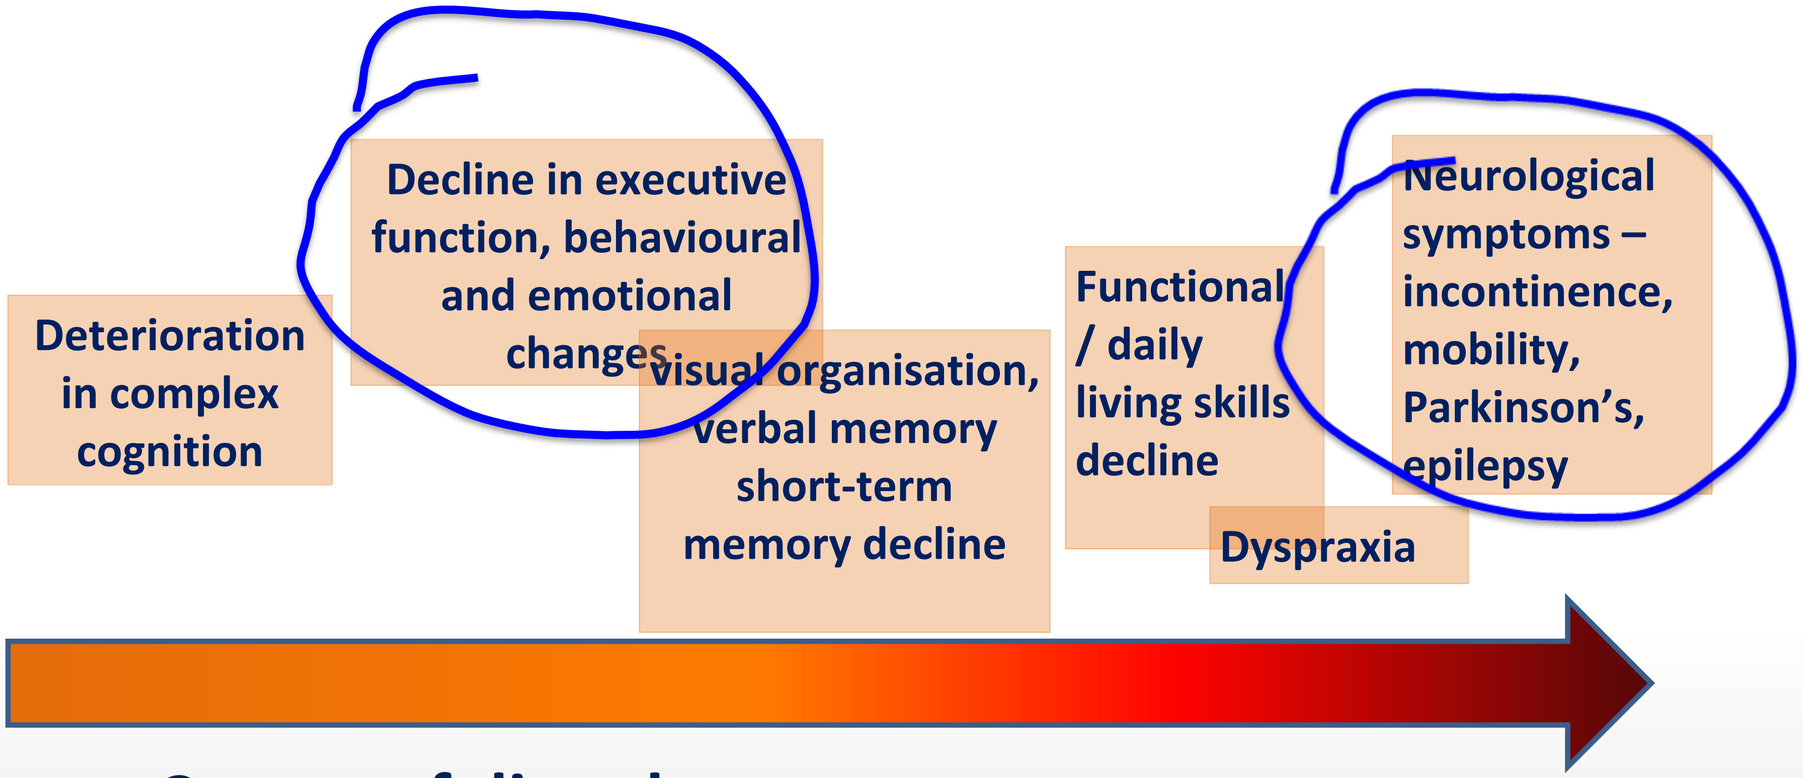
Reduced hippocampal volume (pre-dementia)

Cerebellar hypoplasia

Relative sparing of trunk and posterior cortical structures

Previous research

Course of dementia in Down syndrome



Crayton *et al.* 1998

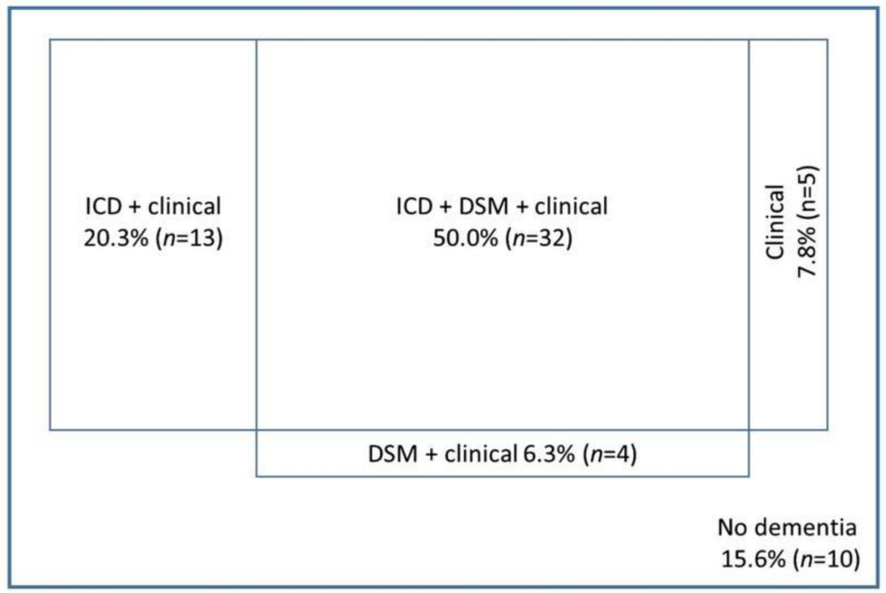
Dementia diagnosis and cognitive outcome measures in adults with Down syndrome

Dementia diagnosis

More difficult in people with learning disabilities

But reliable

- Change from an individual baseline
- Exclude other causes of decline



Int J Geriatr Psychiatry. 2015 August ; 30(8): 857–863. doi:10.1002/gps.4228.

Dementia diagnostic criteria in Down syndrome

Rory Sheehan[1,6], Amanda Sinai[1], Nick Bass[1], Pippa Blatchford[2], Ingrid Bohnen[3], Simon Bonell[4], Ken Courtenay[1,5], Angela Hassiotis[1,6], Therese Markar[7], Jane McCarthy[8], Kamalika Mukherji[7], Asim Naeem[9], Dimitrios Paschos[10], Natalia Perez-Achiaga[2], Vijaya Sharma[11], David Thomas[12], Zuzana Walker[1], and Andre Strydom[1,10,13]

LonDownS research assessment battery

Cognitive assessment: general abilities, memory, executive function, attention, motor coordination
Informant questionnaires: demographics, medical history, dementia symptoms, everyday adaptive abilities, memory, executive function
Physical examination
Biological samples: saliva (genetic analysis), hair (cellular development via induced pluripotent stem cells), blood (blood biomarkers), CSF
EEG assessment: resting state EEG, ERP memory paradigms
fNIRS assessment: executive functioning paradigms

LonDowns cognitive test battery

Cognitive test issues:

- Cannot use usual tests and threshold
- Baseline variable
- Floor effects

Measure earliest changes

- Range of cognitive abilities

Suitable for most people with Down syndrome

- Use both individual tests and carer-ratings
- Adapt scoring
- and difficulty levels where necessary

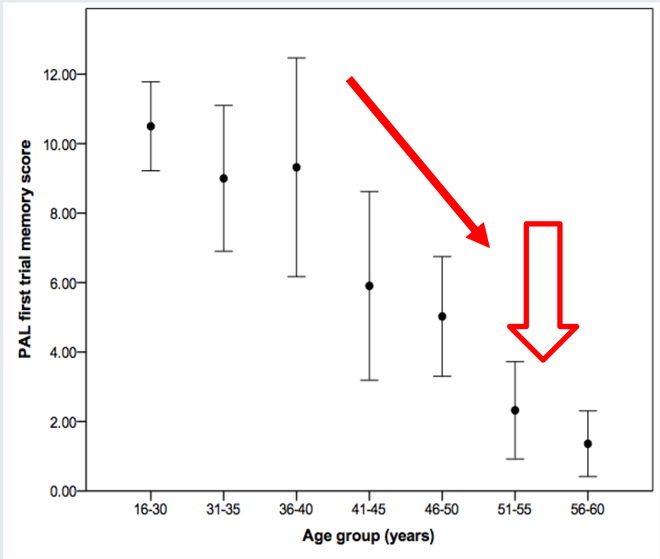
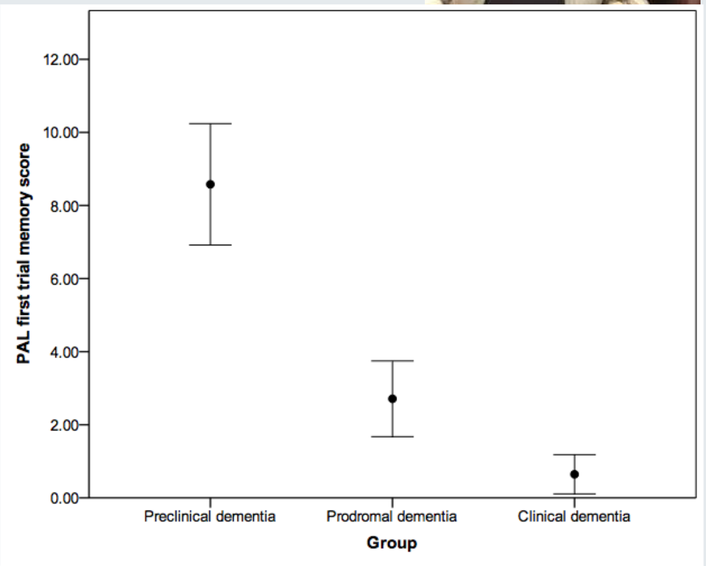
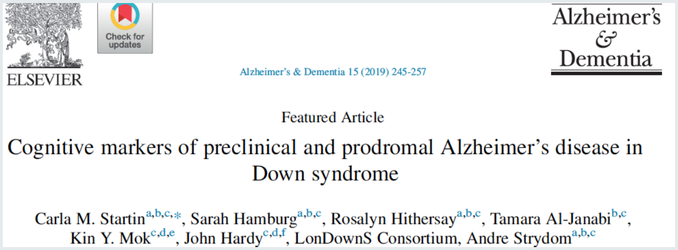
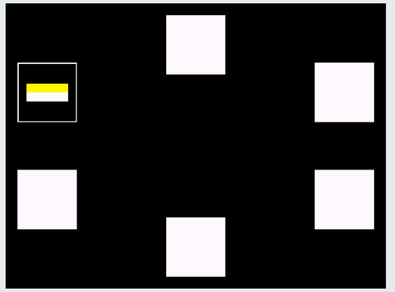
Memory changes with aging





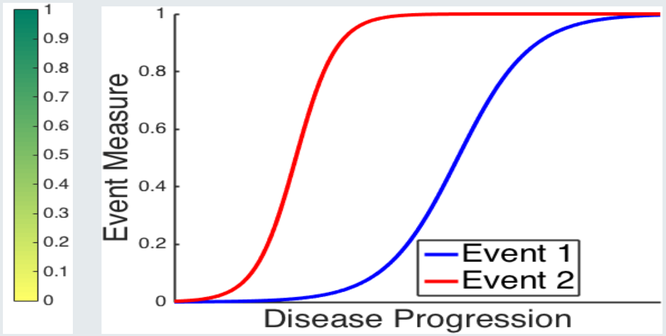
Memory loss years before dementia diagnosis

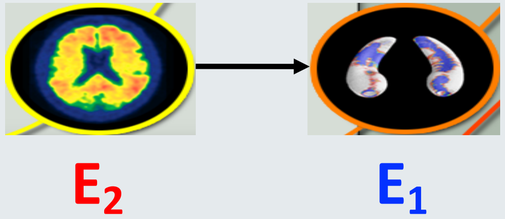


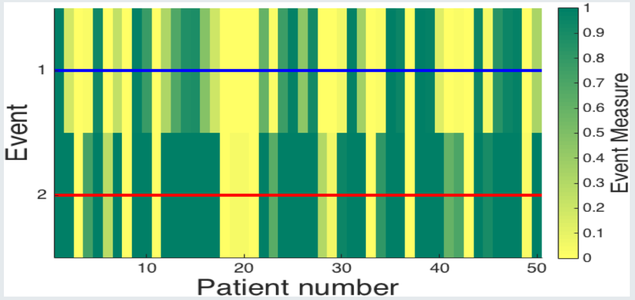


Event-based model (EBM) to identify stages of decline

EBM estimates ordering of **binary events** from data – normal or abnormal
Data can be cross-sectional and any combination of types (imaging, clinical, genetic…)

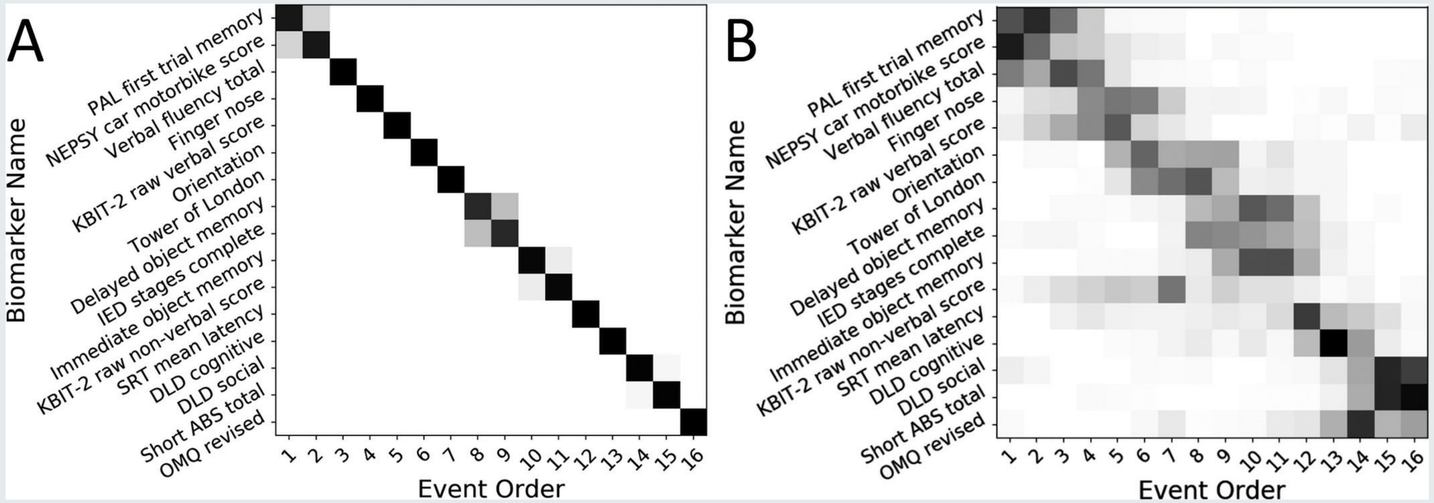






<u>Simple example: 2 event measures</u>
More patients have greater abnormality in Event 2 than Event 1 at particular assessment
→Event2 **measurably abnormal** before Event1

Stages of decline in DS before dementia diagnosis using Event based modelling



Early stages of decline defined by memory and sustained attention tests

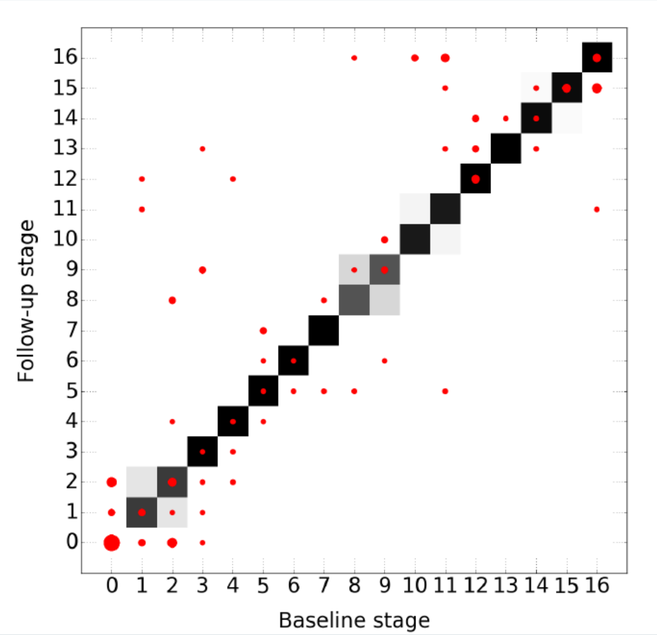
Later stages defined by informant ratings of function (dementia diagnosis)

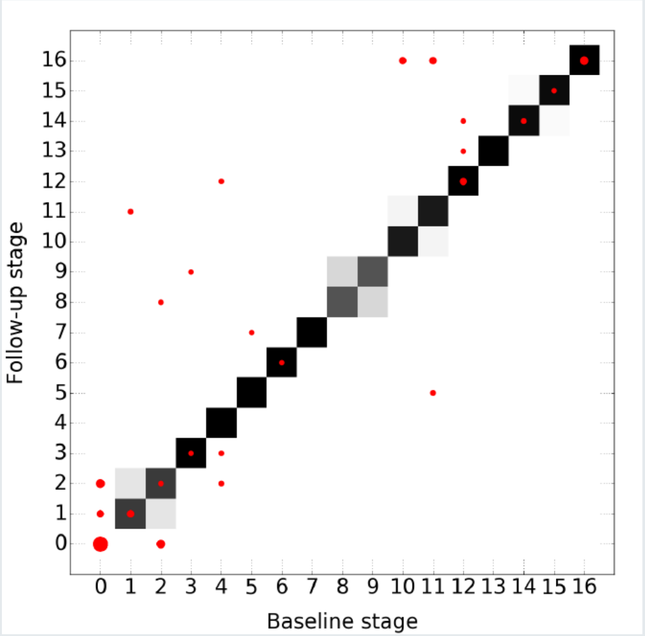
Firth, N. C., Startin, C. M., Hithersay, R., Hamburg, S., Wijeratne, P. A., Mok, K. Y., ... & Strydom, A. (2018). Aging related cognitive changes associated with Alzheimer's disease in Down syndrome. Annals of Clinical and Translational Neurology.

Predictive validity of EBM staging model

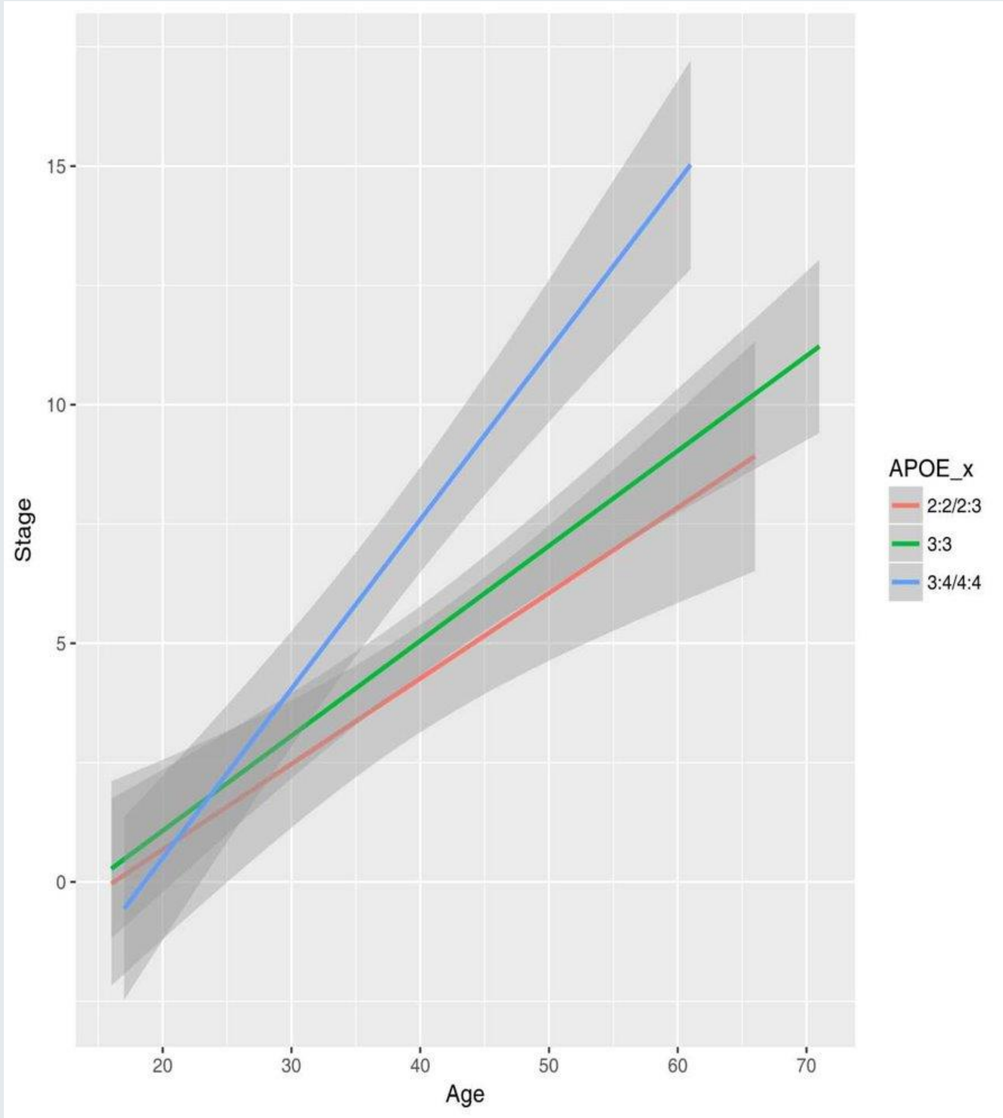
Follow up of older participants (> age 35) after 2 years

- General increase in EBM stage - >80% of participants either increase in stage, or remain the same
- Missing data may explain outliers





Staging by APOE status



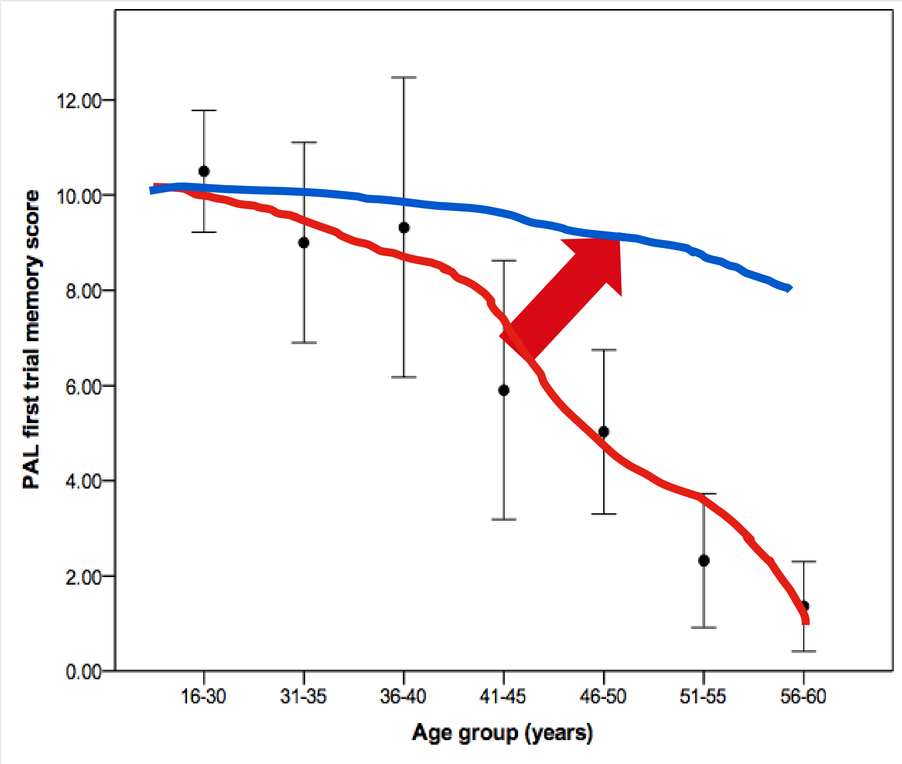
Getting ready for prevention trials in Down syndrome

How many people need to take part in a trial to show an effect?

Longitudinal results - PAL first trial memory score as outcome

For those with preclinical dementia (i.e. no noticeable signs of cognitive decline) and not at floor at baseline:

- 2 year trial n ~ 400 participants (90% power, $p<0.05$)



Biomarkers for Alzheimer's in Down syndrome

Good biomarkers can speed up clinical trials if shown to be linked with clinical outcomes

Neurofilament light: A neuronal structural protein associated with cell death, measured with SIMOA assays in serum

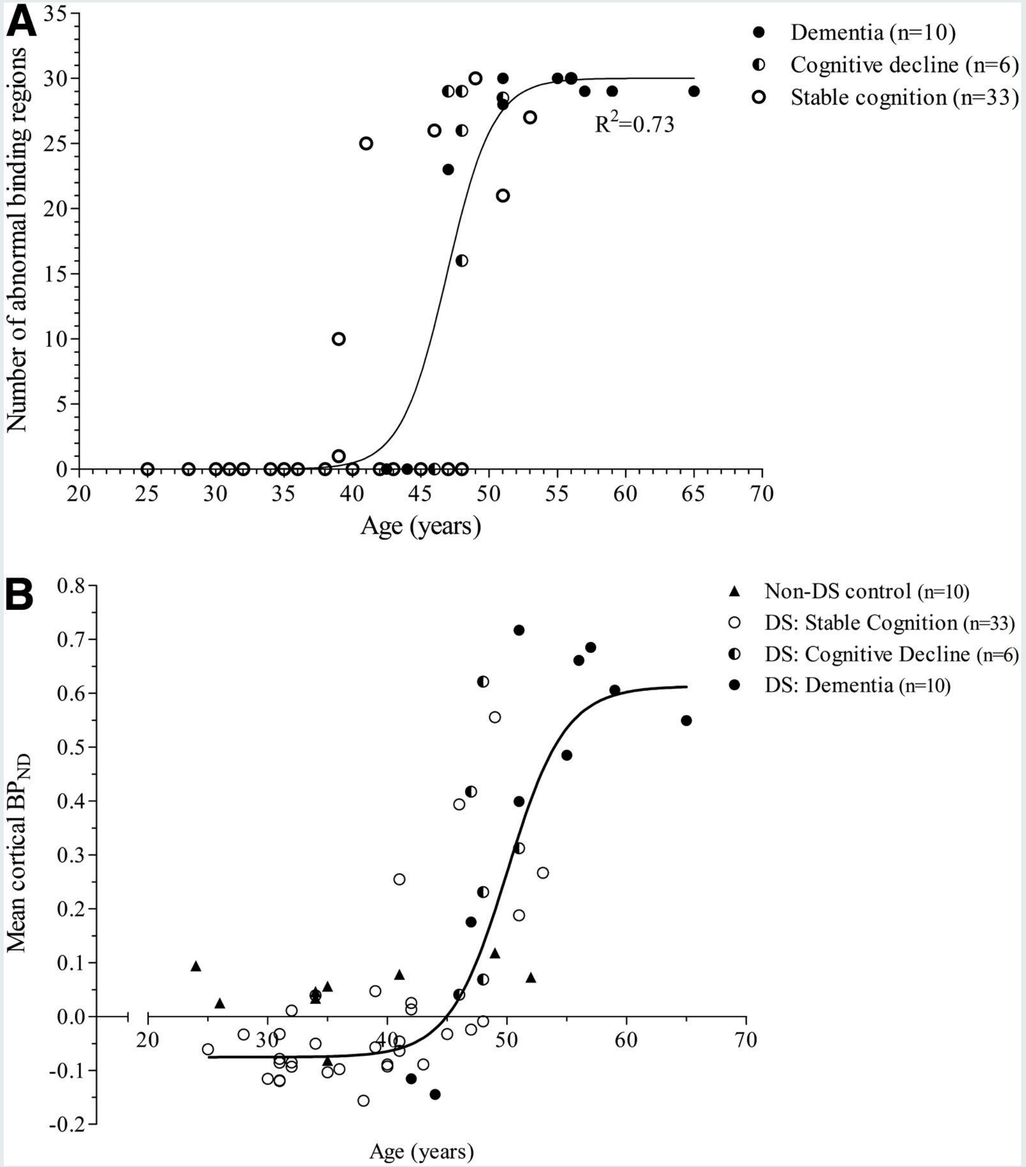
Summary
Background Diagnosis of Alzheimer's disease in Down syndrome is challenging because of the absence of validated

Lancet Neurol 2018

Amyloid PET brain scans



The pattern of amyloid accumulation in the brains of adults with Down syndrome Tiina Annus, Liam R. Wilson, Young T. Hong, Julio Acosta–Cabronero, Tim D. Fryer, Arturo Cardenas–Blanco, Robert Smith, Istvan Boros, Jonathan P. Coles, Franklin I. Aigbirhio, David K. Menon, Shahid H. Zaman, Peter J. Nestor, Anthony J. Holland, Alzheimer's & Dementia, Volume 12, Issue 5, Pages 538-545 (May 2016)

What next?

We can measure cognitive change before onset of Dementia in Down syndrome

- But need better cognitive outcome measures

Promising biomarkers associated with development of Alzheimer's disease

- But need to establish how it relates to cognitive changes and symptom onset over time

Clinical trials based upon rational drug targets is within grasp

- But need to develop clinical trial networks
- Understand underlying biology to select optimal treatments

Cambridge U.
